Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -1- SUBUNIT: Archaeal signal recognition particle consists of a 7S RNA molecule of 300 nucleotides and two protein subunits: SRP54 and SRP19 (By similarity).
-1- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-1- SIMILARITY: Belongs to the SRP19 family.
                                                                                                                                                                                                                                       Archaea; Buryarchaeota; Methanomicrobia; Methanosarcinales;

-!- SUBUNIT: Part of the 30S ribosomal subunit.
-!- SIMILARITY: Belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TIGRFAMS; TIGR01008; rpsC_B_A; 1.

-!- FUNCTION: Involved in the tonB-dependent energy-dependent
-!- FUNCTION: Involved in the tonB-dependent Example to various receptor-bound substrates. Protects exbb from proteclytic degradation and functionally stabilizes tonB (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    *imilarity).
-!- SUBUNIT: The accessory proteins exbB and exbD seem to form a
complex with tonB (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane.
-!- SIMILARITY: Belongs to the exbB / tolQ family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

Claim 3; Page 42; 49pp; English.

The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated colour-facilitating molecule (CFW)

Comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

coloured fleece. They are useful for producing admittional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

cfungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in
                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the identification of complementary peptides by manalysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design.
     (biomatrix). The first all-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Saccharomyces cerevisiae; complementary peptide; peptide identification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                      Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design.

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the ore when visualised by a human ey in the absence of excitation by extraneous when visualised by a human ey in the absence of excitation by extraneous con-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel coloure e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for use include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in cfungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABPS 928-ABPTO48 represent cFM related amino
                                                                                                                                                                                                                                                                                                             Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Colour facilitating molecule; CFM; green fluorescent protein; GFP; chromophore; biomatrix; transgenic animal; colouring agent; flower industry; expression marker; reporter molecule; photon trap;

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous conventies light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for produing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in contemplations of fistorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·.

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human ey in the absence of excitation by extraneous con-white light or particle emission. CFWs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant eversing include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for upholstery. CFMs are useful in the flower inductry, in the development of new varieties of flowering plants. Other contemplated uses include, or expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in correct contemplated to enhance their marketability. CFMs embedded in a gel matrix improve image quality in current sequence to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

```
The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all enained). PPCT may also be used in sunscreen formulations or UV filters
                                                                                                                                                                                                                                                                                                                                                                                          Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-terminal, pigment protein from coral tissue, PPCT, fluorescence, tissue marker, fluorescent marker, dyestuff, sunscreen, ultra violet,

The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a human Cdc5 (hCdc5) protein. The hCdc5 cDNA is useful in the therapy of pathologies such as diseases, syndromes, or other undesirable conditions resulting from defects in cell cycle progression which may result from hCdc5 gene, in the regulation of the hCdc5 gene or in a step downstream of hCdc5 in the regulation of call cycle progression through Q2 and entry into mitosis. It is useful for treating a patient having a hyperproliferative disease such as cancer, coronary artery disease, pulmonary vascular obstructive disease, and other disorders of ahonomal callular proliferation (see AAB61997 for various used of the hCdc5 gene). The present sequence represents a fragment of the c-myb protein, used for amino-terminal
  capable of emitting
light useful as tissue marker,
                                                                                                                                                                                                                       nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cdc5; hCdc5 cell cycle progression; hyperproliferative; cancer; human; coronary artery disease; cellular proliferation; cardiac injury; C-myb; myocardial infarction; cytostatic; cardiant; vasotropic; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             techniques for treating diseases related to cell cycle defect such as
cancer, coronary artery disease, pulmonary obstructive vascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acids comprising human Cdc5 gene useful in gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 100-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters
                                                                                                                                                                                                                                                                                                                                                                           Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-terminal; pigment protein from coral tissue; PPCT; fluorescence;
tissue marker; fluorescent marker; dyestuff; sunscreen; ultra violet;

                                                                               ð
                                                                                                      g
                                                                                                                                                                                   The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, ollowers, and for chromosome and gene mapping, and in recombinant production of (II). (II) the polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations trappositive for assess biodiversity
                                                                              ·
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

The invention also encompasses polypeptides at least 86* identical to the ORFN-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 86* identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and polypeptides, methods of screening individuals for a predisposition or activity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, hammatopoiesis regulation, tissue growth, anglogenesis, activin or inhibin activity, chemotactic/

chemokinetic activity, haemostatic activity, thrombolytic activity,
creceptor/ligand, antiinflammatory activity, tumour inhibition activity,
and analymostic activity, and may also be involved in the determination
of bodily characteristics, fertility and behaviour. ORFX proteins,
confer proliferative disorders may be used in the treatment of cancers,
confer proliferative disorders such as psoriasis and benight tumours,
confer proliferative disorders such as epilepsy and Alzheimer's disease,
corpan transplantation, disorders of tissue growth and regeneration,
diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester
corgan transplantation, disorders of tissue growth and regeneration,
diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester
storage disease, and infectious diseases caused by viral, bacterial,
contranscripts, in the identification and cloning of homologous
contranscripts, in the identification and cloning of produce transgenic animals
which may be useful for studying the function and/or activity of ORFX
contranscripts, and in drug screening.
contranscripts are precific anithodies, which are useful in the
diagnosis, treatment and monitoring of ORFX associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a waccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A61A-(L-alpha-aminoadipyl)-L-cysteinyl-D-valine synthetase - Emericella nidulans
N;Alternate names: ACV synthetase
C;Species: Emericella nidulans, Aspergillus nidulans
C;Species: T-Mar-1992 #sequence_revision 27-Mar-1992 #text_change 03-Nov-2000
C;Accession: A40889; S16466
R;MacCabe, A.P.; van Liempt, H.; Palissa, H.; Unkles, S.E.; Riach, M.B.R.; Pfeifer, E.;
A;Title: delta-(L-alpha-aminoadipyl)-L-cysteinyl-D-valine synthetase from Aspergillus nithway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
